1. Cobb Douglas Production Function

1.1. Math Equation

The Cobb-Douglas production function $E = mc^2$ describes output as a function of inputs, typically capital and labor.

It shows how output changes when input quantities are varied.

$$Y = \gamma x_1^{\alpha_1} x_2^{\alpha_2}$$

Let's type same equation and give it a number

$$Y = \gamma x_1^{\alpha_1} x_2^{\alpha_2} \tag{1}$$

2. Figures

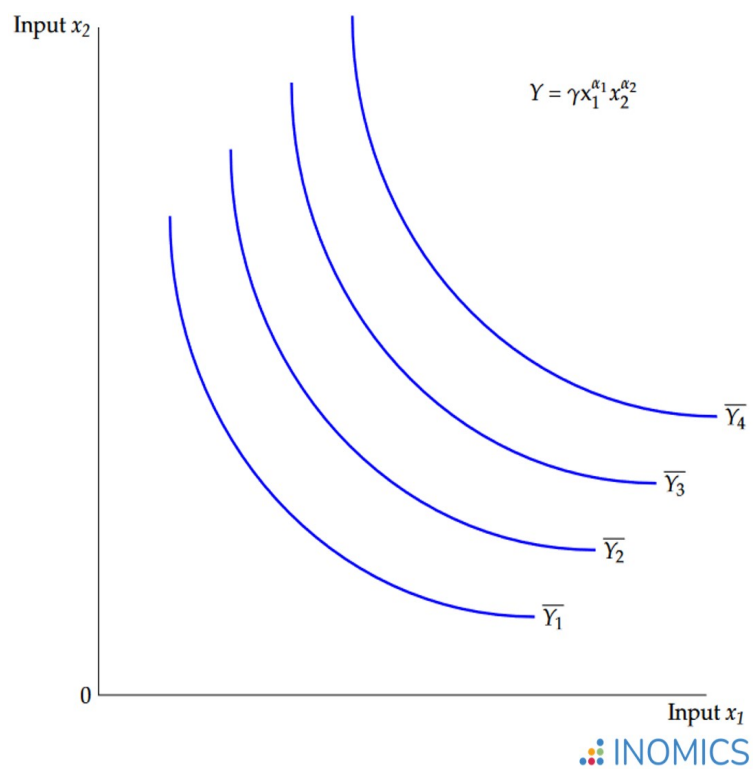

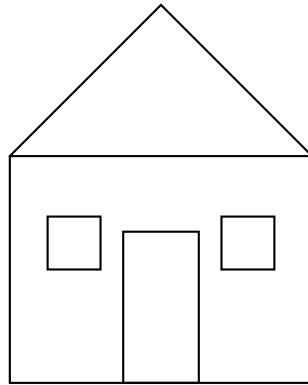

Figure 1: Cobb Douglas Production Function

3. Table

Table 1: Example Table

y	x_1	x_2
10	2	3
15	4	15

4. Drawing picture

5. Citation and referencing

I use this article (?, ?) to understand the production function theory.
